

## This week's update (week26, 2020)

### ~Stream Jet Printing Solution Label~

It's a hybrid type printing solution of label printing + inkjet.

- **Inline type**

By adding the UV inkjet printer **Stream Jet** as an add-on to letterpress and flexographic press, which are often used for label printing, it is possible to perform numbering and variable barcode printing in one stop.

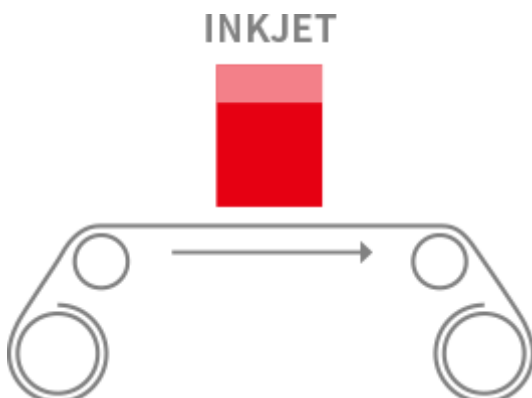

Integrated onto an intermittent letterpress

- **Offline type**

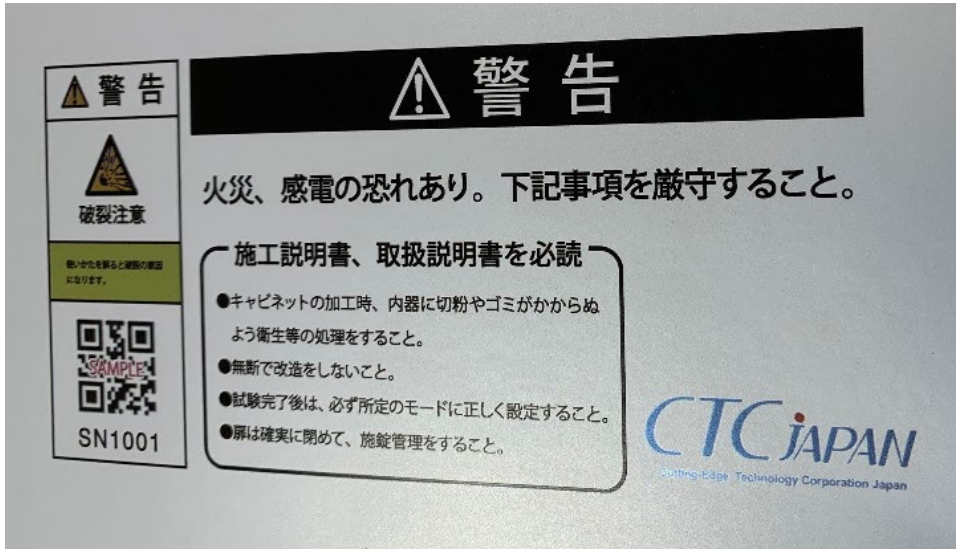

Only variable printing is performed with **Stream Jet** by overprinting on preprinted labels.

By adding **Stream Jet** to the inspection machine or post-processing machine, the range of label printing processing can be expanded.

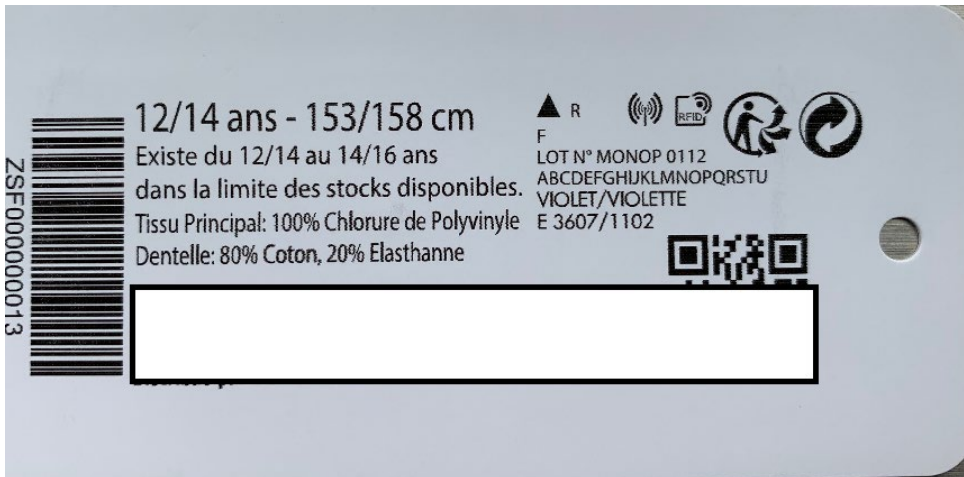

Application example (The following is an example only)

★Industrial nameplate

It is used to display serial numbers and individual product names. Inkjet printers are ideal for small lot production. The above photo is an example of performing both fixed and variable image with [Stream Jet](#).

★Care labels & Hanging tags

In recent years, care labels for apparel (laundry mark) and hanging tags (attached to apparel products), the number of cases of using [Stream Jet](#) is increasing. The above photo is an example of RFID inlay & tag. RFID (IC chip with antenna) is embedded in the tag to enable consistent printing and encoding.
